1	Basics about $\text{\LaTeX}$ via RStudio	1
2	Using Sweave and knitr in RStudio	1

1 Basics about L^AT_EX via RStudio

First, notice that you can open a L^AT_EX .tex file from within RStudio. This file is recognized as a .tex file — and you can translate it via the Compile PDF option from within RStudio!

When working with .tex in RStudio, you have options to introduce some L^AT_EX formatting via highlighting and mouse clicks. Let's try this for the words bold, italic, and typewriter.

Now, we want a new subsection

Notice what is being produced here!

And what about a bullet list hereafter?

2 Using Sweave and knitr in RStudio

Detailed information can be found at <http://www.rstudio.com/ide/docs/authoring/overview>.

Basically, you need to start at **File** — > **New** — > **R Sweave**. Let's do so.

If you want to use an existing .tex file, you must change the file extension to .Rnw and add the line

```
\SweaveOpts{concordance=TRUE}
```

after the

```
\begin{document}
```

line.
